### Key to Document Status Codes:

|                         |  |
|-------------------------|--|
| <b>Work in Progress</b> | An incomplete document, designed to guide discussion and generate feedback, that may include several alternative requirements for consideration.   |
| <b>Draft</b>            | A document in specification format considered largely complete, but lacking review by Members and vendors. Drafts are susceptible to substantial change during the review process.         |
| <b>Issued</b>           | A stable document, which has undergone rigorous member and vendor review and is suitable for product design and development, cross-vendor interoperability, and for certification testing. |
| <b>Closed</b>           | A static document, reviewed, tested, validated, and closed to further engineering change requests to the specification through CableLabs.  |

### Trademarks

Advanced Digital Cable™, CableCARD™, CableHome®, CableLabs®, CableNET®, CableOffice™, CablePC™, DCAS™, DOCSIS®, DPoE™, EBIF™, eDOCSIS™, EuroDOCSIS™, EuroPacketCable™, Go2BroadbandSM, M-Card™, M-CMTS™, OCAP™, OpenCable™, PacketCable™, PCMM™, and tru2way® are marks of Cable Television Laboratories, Inc. # 1 SCOPE

## 1.1 Introduction and Overview

Broadcasters and network operators around the world are deploying interactive applications by creating enhancements to a broadcast video stream. These Enhanced Television (ETV) applications rely on embedding various types of data in the video stream, including programs, images, and triggers.

This document specifies the synchronization and signaling mechanisms to be used by ETV applications, regardless of the target receiver or middleware environment. ETV mechanisms must be implementable by legacy set-top boxes as well as OpenCable (OCAP) host devices, and this implementation requirement implies that more than one option must exist for the physical transmission of the signaling and trigger data. This document addresses those various options and describes how a set-top box should interpret signals and triggers delivered via each of those methods.

## 1.2 Purpose of document

The purpose of this document is to specify ETV application signaling and synchronization mechanisms that meet all of the objectives/requirements of North American cable systems for delivering video-synchronous ETV applications, whether they are broadcast or delivered on-demand.

The intent is to propose a uniform method of inserting signals and triggers that is independent of application environments and software/technology vendors. That said, it is understood that accommodations must be made for the support of specific legacy set-top boxes such as the DCT-2000 and Explorer 2000, while also supplying a standard rich enough to work with advanced set-top boxes based on the OpenCable Host 2.0 Core Functional Requirements [HOST2.1].

In some cases, the need to support a range of devices may result in the need to have more than one signaling packet delivered through the network for the same application. As the number of legacy set-top boxes drops to zero, in any given division over the next several years, this requirement would be relaxed.

This document does not attempt to impose a selection of a particular vendor for implementation. The design of the system is largely based on open industry standards with an objective to leverage currently existing equipment and tools available for implementing such a system.

## 1.3 Organization of document

This document is divided into four parts:

- a description of the type of applications to be addressed by this specification,
- application signaling and life-cycle management,
- application synchronization and timeline management,
- platform-specific constraints imposed by legacy environments.

## 1.4 Requirements

Throughout this document, the words that are used to define the significance of particular requirements are capitalized. These words are:

|              |   |
|--------------|---|
| “SHALL”      | This word means that the item is an absolute requirement of this specification.   |
| “SHALL NOT”  | This phrase means that the item is an absolute prohibition of this specification.   |
| “SHOULD”     | This word means that there may exist valid reasons in particular circumstances to ignore this item, but the full implications should be understood and the case carefully weighed before choosing a different course.   |
| “SHOULD NOT” | This phrase means that there may exist valid reasons in particular circumstances when the listed behavior is acceptable or even useful, but the full implications should be understood and the case carefully weighed before implementing any behavior described with this label. |
| “MAY”        | This word means that this item is truly optional. One vendor may choose to include the item because a particular marketplace requires it or because it enhances the product, for example; another vendor may omit the same item.  |

### 3 TERMS AND DEFINITIONS

This specification uses the following terms:

|                                  |  |
|----------------------------------|--|
| <b>Application Signal</b>        | A broadcast message that provides information to a receiver necessary to acquire, launch, and terminate an ETV application.  |
| <b>Enhanced Television (ETV)</b> | A general term that refers to interactive services and applications provided in conjunction with video programming.  |
| <b>Enhancement</b>               | A software application that executes in conjunction with video programming.  |
| <b>Trigger</b>                   | A broadcast message that provides a synchronization mechanism to an enhancement. Triggers may be embedded in the associated video program, or delivered via another means such as OOB. Triggers may also be used for the delivery of unsolicited data to an enhancement. Triggers may include application signals and stream events. |
| <b>Stream Event</b>              | A type of Trigger that conveys application defined messages to an enhancement. ETV stream events are normatively defined within this specification.  |
| <b>User Agent</b>                | An application running on a receiver that decodes and executes the enhancement.  |

## 4 ABBREVIATIONS AND ACRONYMS

This specification uses the following abbreviations:

|               |  |
|---------------|--|
| <b>AIT</b>    | Application Information Table                          |
| <b>bslbf</b>  | bit-string left bit first                              |
| <b>DCI</b>    | DigiCipher II  |
| <b>DSM-CC</b> | Digital Storage Module - Command and Control           |
| <b>DTD</b>    | Document Type Definition                               |
| <b>DVR</b>    | Digital Video Recorder                                 |
| <b>EBIF</b>   | ETV Binary Interchange Format                          |
| <b>ETV</b>    | Enhanced Television                                    |
| <b>EISS</b>   | ETV Integrated Signaling Stream                        |
| <b>IB</b>     | In-band  |
| <b>NPT</b>    | Normal Play Time                                       |
| <b>OOB</b>    | Out-of-Band  |
| <b>PMT</b>    | Program Map Table                                      |
| <b>PTS</b>    | Presentation Time Stamp                                |
| <b>rpchof</b> | remainder polynomial coefficients, highest order first |
| <b>uimsbf</b> | unsigned integer most significant bit first            |
| <b>URI</b>    | Uniform Resource Identifier                            |
| <b>VBI</b>    | Vertical Blanking Interval                             |

## 5 ENHANCED TELEVISION APPLICATION MODEL

### 5.1 ETV Applications

This specification is intended to support a wide variety of program synchronous applications, such as:

- Interactive Advertising
- Game Shows
- News
- Sports Events
- Voting applications
- Impulse upgrade promotions
- E-commerce applications

This specification addresses both live broadcasts and pre-recorded programs and supports “real-time” viewing as well as time-shifted (DVR) viewing and interaction.

### 5.2 ETV Authoring Process

There are several important factors in the creation and deployment of ETV applications:

- Production Team
- Cable Operator
- Network Broadcaster
- Application Server

Figure 1 provides a graphical illustration of the relationships between these functional groups.

#### 5.2.1 Production Team

Application production teams generate the interactive enhancements in conjunction with the studios that produce the video. Applications are often built around templates for the triggers and data that are inserted by a production team.

For pre-recorded shows, the application signaling and triggers are mastered during the video post-production process before the show is broadcast. Throughout the production process, the production team uses a media timeline based on SMPTE time codes, which are used for synchronization of video tape.

For live shows, the application itself may be prepared in advance, but the actual data to feed the application is inserted dynamically—for example: Who just won the Oscar for Best Director?

#### 5.2.2 Network Broadcaster

Enhancements cannot be bound to a program until after the video has been digitized for final broadcast. Furthermore, the video feeds from the major networks are often converted back to analog by a local network affiliate and then re-digitized for use by the local cable company, losing many enhancements along the way. Cable channels have the advantage of staying in the digital domain and so can insert all enhancements at the digital encoding stage.

Applications and triggers must be inserted into the video stream by the broadcaster using synchronization triggers and play lists that are appropriate for the type of equipment used in the broadcast environment. At the same time, broadcasters may have to rely on sending those enhancements across a broadband connection to cable companies and affiliates who do not preserve the full digital signal from beginning to end. Some enhancements can be sent

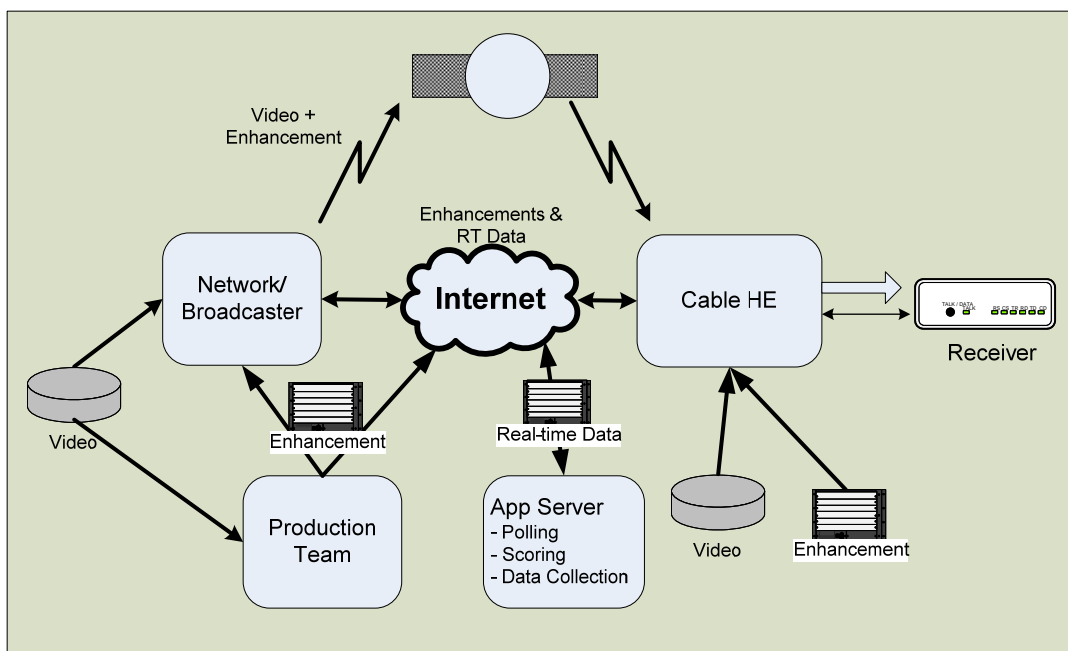

ahead of time for automatic insertion on a given schedule. Others may be transmitted in real time and synchronized to live events—either by production teams directly, or via the broadcasters or the cable operators.

### 5.2.3 Cable Operators

Some cable operators generate their own programming and enhancements. Again, they are responsible for obtaining the enhancement from the Production Team and inserting the application, signaling and triggers into the video streams, adding to or replacing video segments received from the satellite. At this point, cable operators may be working in either the analog or digital domain, because the video may be in either state before final transmission to the subscriber. Unfortunately, analog and digital video place different requirements on the data insertion equipment.

### 5.2.4 Application Servers

Although it probably does not signal a base enhancement directly, a polling or score server MAY be used to dynamically process subscriber votes or quiz answers and send responses back to particular client receivers. Messages sent from the polling server MAY require routing or insertion by the cable operator back into either an IB or OOB data stream to a client.

**Figure 1 - Enhancement Distribution Process**

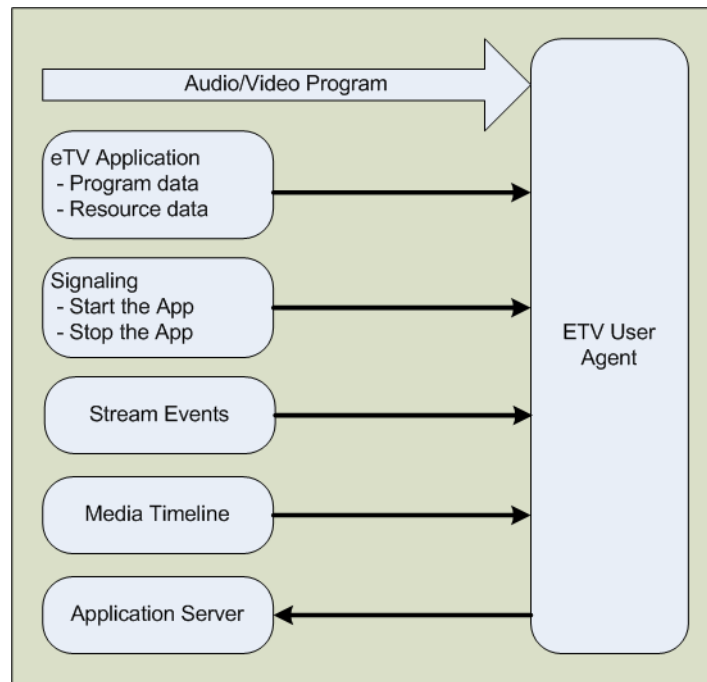

## 5.3 Enhanced Television Components

An enhanced television application is made up of several components:

- Broadcast Audio/Visual program
- ETV Application Program and Resource Data
- Application Signaling
- Stream Events/Triggers
- Media Timeline

In addition, an ETV application MAY send data to an application server. Responses from the server MAY come in the form of new application resources or stream events.

These components are illustrated in Figure 2.

**Figure 2 - Enhanced Television components**

While all of these components together complete the ETV application, it helps to look at them separately in the context of discussing their delivery and formats:

- The **ETV application** is the subject of other specifications, such as OpenCable Enhanced Television (ETV) [ETV-BIF], although this specification will discuss the delivery and encapsulation of the ETV application data.
- **Signaling** commands defined in this specification tell the ETV User Agent in the client receiver to start and stop the application, and identify how to find and load the primary elements of the application.
- **Stream Events** deliver “unsolicited” data to an application, synchronized with the video stream.
- The **Media Timeline** provides the basic timing references to which stream events are synchronized.
- **ETV Application Servers** are used for collecting the results of an ETV application, such as requests for additional information or storing poll or voting responses.

One advantage of separating the ETV application format from this signaling specification is that this specification can be used to signal a number of different types of applications, including ones written to OpenCable Enhanced Television (ETV) [ETV-BIF], as well as to other specifications yet to be written. In general, the problems of signaling and media synchronization are universal, regardless of the type of application being signaled.

## 5.4 Media Timeline

A Media Timeline is a continuous timeline over the duration of an event. An event is defined in [IEC 13818-1] as a collection of elementary streams with a common time base, an associated start time, and an associated end time. A typical, but not normative example, is the video and audio for a single television show.

The Media Timeline refers to the real time of the event. For example, when an event is presented in reverse, the timeline counts down rather than up; and when an event is presented at 10 times the normal rate, the timeline progresses at 10 times the normal rate. In this way, the Media Timeline increases and decreases in a way similar to a counter on a video tape recorder and provides an absolute timeline to which references can be made for operations such as jumping to a particular point in the event.

Media timelines can be paused, for example, during a commercial break which occurs interstitially between two segments of the event. Media timelines can also be nested, for example, if the commercial itself contains an enhancement.

## 6 ENHANCED TELEVISION APPLICATION SIGNALING

### 6.1 Introduction

This section defines the data formats and transmission mechanisms that enable receivers to discover, download, launch, and terminate ETV applications.

### 6.2 Program Map Table Descriptors

The following PMT descriptors are defined by this specification:

- ETV registration descriptor
- ETV integrated signaling descriptor
- ETV-BIF platform descriptor

#### 6.2.1 ETV Registration Descriptor

The `etv_registration_descriptor` is defined for use in the elementary stream information loop of the PMT. The ETV registration descriptor [IEC 13818-1], table 2-46 – Registration Descriptor, clause 2.6.8 is defined to identify unambiguously the programs that comply with this specification. The ETV registration descriptor SHALL be carried in the elementary stream information loop of the PMT for each program component that conveys an ETV integrated signaling stream or ETV application resource stream. The presence of the registration descriptor uniquely and unambiguously identifies the formats of the private data used within this specification, including private use fields and identifiers within *user private* ranges such as descriptor tags and MPEG private section table ids.

The `etv_registration_descriptor` is defined in Table 1.

**Table 1 - ETV Registration Descriptor Syntax**

| Syntax                                       | Bits | Mnemonic |
|--|------|----------|
| <code>etv_registration_descriptor() {</code> |      |          |
| <code>descriptor_tag</code>                  | 8    | uimsbf   |
| <code>descriptor_length</code>               | 8    | uimsbf   |
| <code>etv_format_identifier</code>           | 32   | bslbf    |
| <code>}</code>                               |      |          |

**descriptor\_tag** This 8-bit integer with value 0x05 identifies this descriptor.

**descriptor\_length** This 8-bit integer indicates the number of bytes following the descriptor length field.

**etv\_format\_identifier** CableLabs has assigned a value of 0x45545631 (ASCII “ETV1”) to this 4-byte field to identify the program component (within a multiplex) in which it is carried as complying with this specification.

**Note:** This value must be registered with the SMPTE Registration Authority, LLC and is subject to change. SMPTE is authorized by the International Organization for Standardization (ISO) to register MPEG-2 format identifiers per [IEC 13818-1]:2000 Annex O: Registration procedure [for "format\_identifier"].

## 6.2.2 ETV Integrated Signaling Descriptor

The `etv_integrated_signaling_descriptor` is defined for use in the elementary stream information loop of the PMT. This descriptor indicates that the associated elementary stream contains an ETV integrated signaling stream, as defined in Section 7 of this specification. Only one elementary stream signaled by the PMT SHALL contain an `etv_integrated_signaling_descriptor`. In the event that more than one PMT entry contains an `etv_integrated_signaling_descriptor`, the behavior of the ETV receiver is undefined.

A PMT entry with an `etv_integrated_signaling_descriptor` MAY be associated with a `stream_type` of 0xC0 or 0x05.

The `etv_integrated_signaling_descriptor` is defined in Table 2.

**Table 2 - ETV Integrated Signaling Descriptor Syntax**

| Syntax   | Bits | Mnemonic |
|--|------|----------|
| <code>etv_integrated_signaling_descriptor() {</code> |      |          |
| <code>descriptor_tag</code>                          | 8    | uimsbf   |
| <code>descriptor_length</code>                       | 8    | uimsbf   |
| <code>platform_id_length</code>                      | 8    | uimsbf   |
| <code>for (i=0; i&lt;m; i++){</code>                 |      |          |
| <code>etv_bif_platform_id()</code>                   |      |          |
| <code>}</code>                                       |      |          |
| <code>for (i=0; i&lt;n; i++) {</code>                |      |          |
| <code>private_use</code>                             | 8    | bslbf    |
| <code>}</code>                                       |      |          |
| <code>}</code>                                       |      |          |

|                            |   |
|----------------------------|---|
| <b>descriptor_tag</b>      | This 8-bit integer with value 0xA2 identifies this descriptor.  |
| <b>descriptor_length</b>   | This 8-bit integer indicates the number of bytes following the descriptor length field.   |
| <b>platform_id_length</b>  | This 8-bit integer specifies the number of bytes of the <code>etv_bif_platform_id</code> fields immediately following this <code>platform_id_length</code> field. This value MAY be zero.   |
| <b>etv_bif_platform_id</b> | This field contains zero or more <code>etv_bif_platform_id</code> structures, as defined in Table 4.<br><br>If <code>platform_id_length</code> is zero (i.e., there are no <code>etv_bif_platform_id</code> structures listed by this descriptor), the associated elementary stream SHALL be decoded on ALL platforms. If <code>platform_id_length</code> is non-zero, this descriptor SHALL contain an <code>etv_bif_platform_id</code> structure for each supported platform. |
| <b>private_use</b>         | This field may be used to carry private data to a receiver or user agent which interprets this signaling stream. Its use is not defined by this specification.  |

## 6.2.3 ETV-BIF Platform Descriptor

The `etv_bif_platform_descriptor` is defined for use in the elementary stream information loop of the PMT. This descriptor indicates to a receiver that the associated elementary stream carries ETV-BIF application resources for one or more hardware/software platforms (as identified by [ETV-BIF]) each of which SHALL be listed in this descriptor.

Resources that target baseline receivers SHALL be transmitted on a single elementary stream. Resources that target other receivers MAY be transmitted across multiple elementary streams. In this case, an `etv_bif_platform_descriptor`, which identifies the targeted platform, SHALL be included in the PMT entry that corresponds to each elementary stream carrying those resources.

An elementary stream MAY contain resources that target different collections of platforms. An elementary stream MAY also contain resources for multiple applications; (for example, resources for the primary broadcast program and resources for an enhanced advertisement). The PMT elementary stream information loop MAY contain multiple instances of an `etv_bif_platform_descriptor`.

The `etv_bif_platform_descriptor` is defined in Table 3.

**Table 3 - ETV-BIF Platform Descriptor Syntax**

| Syntax                                       | Bits | Mnemonic |
|--|------|----------|
| <code>etv_bif_platform_descriptor() {</code> |      |          |
| <code>descriptor_tag</code>                  | 8    | uimsbf   |
| <code>descriptor_length</code>               | 8    | uimsbf   |
| <code>for (i=0; i &lt; n; i++) {</code>      |      |          |
| <code>etv_bif_platform_id()</code>           |      |          |
| <code>}</code>                               |      |          |
| <code>}</code>                               |      |          |

**descriptor\_tag** This 8-bit integer with value 0xA1 identifies this descriptor.

**descriptor\_length** This 8-bit integer indicates the number of bytes following this field.

**etv\_bif\_platform\_id** This field contains zero or more `etv_bif_platform_id` structures, as defined in Table 4.

If `descriptor_length` is zero (i.e., there are no `etv_bif_platform_id` structures listed by this descriptor), the associated elementary stream SHALL carry resources that target ALL platforms.

**Table 4 - ETV-BIF Platform ID Syntax**

| Syntax                               | Bits | Mnemonic |
|--------------------------------------|------|----------|
| <code>etv_bif_platform_id() {</code> |      |          |
| <code>pdtHWManufacturer</code>       | 24   | uimsbf   |
| <code>pdtHWModel</code>              | 16   | uimsbf   |
| <code>pdtHWVersionMajor</code>       | 8    | uimsbf   |
| <code>pdtHWVersionMinor</code>       | 8    | uimsbf   |
| <code>pdtSWManufacturer</code>       | 24   | uimsbf   |
| <code>pdtSWModel</code>              | 16   | uimsbf   |
| <code>pdtSWVersionMajor</code>       | 8    | uimsbf   |
| <code>pdtSWVersionMinor</code>       | 8    | uimsbf   |
| <code>pdtProfile</code>              | 8    | uimsbf   |
| <code>}</code>                       |      |          |

All fields in this table are defined in [ETV-BIF], section 9.5.

### 6.3 Application Signaling for Analog Services

Application Signaling for analog services is out-of-scope for this specification.

## 7 ENHANCED TELEVISION SYNCHRONIZATION SIGNALING

Synchronization of an application to a video program requires the establishment of a reference media timeline. A media timeline allows a receiver to deliver stream events to an application at very specific points within the timeline.

OCAP devices are capable of using NPT descriptors and stream events embedded within a DSM-CC Object Carousel for this purpose as defined in sections 8.1 and 8.3 of DSM-CC [IEC 13818-6]. NPT descriptors establish the reference timeline. Stream events carry synchronous application data. Limited-capability devices, however, are not capable of properly interpreting and processing the DSM-CC Object Carousel and the descriptors carried therein.

This section defines a set of descriptors which all devices are capable of receiving, designed for maintaining a media timeline and delivering synchronous data to an application.

Because of the limitations of the very low-end legacy receivers, there are requirements to combine the media timeline messages and stream events into a single, unified elementary stream. This unified stream SHALL also carry additional descriptors as identified in this section.

This unified stream SHALL be known as an ETV integrated signaling stream (EISS). It is possible that an operator MAY deliver an EISS as well as a DSM-CC object carousel with embedded NPT & stream event descriptors. In this case, the receiver MAY use the media timeline that is best suited for its capabilities.

Only one EISS stream SHALL be conveyed for an MPEG-2 program. The EISS stream may carry EISS tables for multiple applications, each identified by an application identifier and application instance identifier. An individual EISS table for an application SHALL NOT be interleaved with EISS table sections of another application. Therefore, this specification recommends that individual EISS tables be kept small to avoid any latency in delivering the EISS tables for other applications.

### 7.1 EISS Table

The descriptors defined in this section are carried in an EISS Table. This table is contained in one or more MPEG-2 sections with syntax as specified in Table 5.

**Table 5 - EISS Section Syntax**

| Syntax   | Bits | Mnemonic |
|--|------|----------|
| eiss_section() {   |      |          |
| table_id   | 8    | uimsbf   |
| section_syntax_indicator                                   | 1    | bslbf    |
| reserved1  | 3    | bslbf    |
| section_length   | 12   | uimsbf   |
| reserved2  | 8    | uimsbf   |
| section_number   | 8    | uimsbf   |
| last_section_number  | 8    | uimsbf   |
| protocol_version_major                                     | 8    | uimsbf   |
| protocol_version_minor                                     | 8    | uimsbf   |
| application_type   | 16   | uimsbf   |
| application_identifier()                                   | 48   |          |
| application_instance_identifier_length                     | 8    | uimsbf   |
| for (i=0; i<application_instance_identifier_length; i++) { |      |          |
| application_instance_identifier_data[]                     | 8    | uimsbf   |
| }  |      |          |
| platform_id_length   | 8    | uimsbf   |
| for (i=0; i<m; i++) {                                      |      |          |
| etv_bif_platform_id()                                      |      |          |
| }  |      |          |
| for (i=0; i<N; i++) {                                      |      |          |
| eiss_descriptor()  |      |          |
| }  |      |          |
| CRC_32   | 32   | rpchof   |
| }  |      |          |

|                                 |  |
|---------------------------------|--|
| <b>table_id</b>                 | This 8-bit integer with value 0xE2 identifies this table.  |
| <b>section_syntax_indicator</b> | The <code>section_syntax_indicator</code> is a 1-bit field that SHALL be set to 0.   |
| <b>reserved1</b>                | This 3-bit field SHALL be set to 000.  |
| <b>section_length</b>           | This is a 12-bit field that specifies the number of bytes of the section starting immediately following the <code>section_length</code> field, up to and including the <code>CRC_32</code> field. The value in this field SHALL not exceed 1021.   |
| <b>reserved2</b>                | This 8-bit field SHALL be set to 0x00.   |
| <b>section_number</b>           | This 8-bit field gives the number of the section. The <code>section_number</code> of the first section in the table SHALL be 0x00. The <code>section_number</code> SHALL be incremented by 1 with each additional section with the same <code>table_id</code> .  |
| <b>last_section_number</b>      | This 8-bit field specifies the number of the last section (that is, the section with the highest <code>section_number</code> ) of the table of which this section is part.   |
| <b>protocol_version_major</b>   | This 8-bit field specifies a major version number for the ETV messaging protocol being conveyed in the ETV streams for the currently signaled application. The required value is expected to be incremented each time a backward-incompatible revision is published to the implied user agent semantics or to a fundamental syntactic structure of the ETV-AM protocol. The major version number corresponding to this specification is 6.<br><br>If the specified major version for the ETV messaging protocol is not supported and the application has not yet been loaded, then the user agent SHALL ignore |

the application being signaled; otherwise, if the application has been loaded, then the user agent SHALL cause an `UnsupportedVersionError` condition to be signaled, and subsequently, a terminating transition SHALL be triggered.

**protocol\_version\_minor**

This 8-bit field specifies a minor version number for the ETV messaging protocol being conveyed in the ETV streams for the currently signaled application. The required value is expected to be incremented each time a backward-compatible revision is published to the implied user agent semantics or to a fundamental syntactic structure of the ETV-AM protocol. The minor version number corresponding to this specification is 0.

If the specified minor version for the ETV messaging protocol is not supported, then the user agent SHALL cause an `UnsupportedVersionError` condition to be signaled once a loading transition has been effected.

**application\_type**

This 16-bit integer identifies the type of application being signaled. The following application types are defined:

**Table 6 - Application Types**

| <b>application_type</b> | <b>Description</b>                                  |
|-------------------------|---|
| 0x0000 – 0x0007         | Reserved by CableLabs                               |
| 0x0008                  | ETV-Binary Interchange Format (ETV-BIF) application |
| 0x0009                  | Switch Engine application                           |
| 0x000A                  | Decision Engine application                         |
| 0x000B – 0xBFFF         | Reserved by CableLabs                               |
| 0xC000 – 0xFFFFD        | Private use   |
| 0xFFFFE – 0xFFFF        | Reserved by CableLabs                               |

**application\_identifier**

This 48-bit integer identifies the application according to DVB-MHP section 10.5 [MHP].

**application\_instance\_identifier\_length**

An unsigned integer that denotes the number of bytes in the application instance identifier data string.

**application\_instance\_identifier\_data[]**

An array of bytes that comprise the UTF-8 form of the encoded string as defined by [UTF-8] which identifies the application instance. This array of bytes SHALL NOT contain a NUL termination byte (0x00).

**Note:** This format supports a Version 1 (MAC-based) UUID as defined in [RFC 4122] and encoded as a Base64URL string as defined in [RFC 4648]. The 16-byte binary UUID will encode to a 22-byte string by using a modified Base64 for URL variant, where no padding '=' will be used, and the '+' and '/' characters of standard Base64 are respectively replaced by '-' and '\_'.

**platform\_id\_length**

This 8-bit integer specifies the number of bytes of the `etv_bif_platform_id` fields immediately following this `platform_id_length` field. This value MAY be zero.

**etv\_bif\_platform\_id**

This field contains zero or more `etv_bif_platform_id` structures, as defined in Table 4. If `platform_id_length` is zero, this `eiss_section` applies to all platforms. If `platform_id_length` is non-zero, this field identifies the set of platforms for which this `eiss_section` applies. All of the `eiss_sections` for a single `eiss` table SHALL specify the same set of platforms.

**eiss\_descriptor** Zero or more descriptors as specified in Section 7.2.  
**CRC\_32** This 32-bit field SHALL be set as defined in [IEC 13818-1], Annex B.

## 7.2 EISS Descriptors

The contents of this section are applicable when the value of the application\_type field of the eiss\_section equals 0x0008 (ETV\_BIF). This section defines the following EISS descriptors:

- ETV Application Information Descriptor
- ETV Media Time Descriptor
- ETV Stream Event Descriptor
- ETV Application Metadata Descriptor

### 7.2.1 ETV Application Information Descriptor

Because limited-capability devices cannot process normal AITs, the relevant fields from the AIT SHALL be embedded in the EISS as an application information descriptor, described in Table 7.

**Table 7 - ETV Application Information Descriptor Syntax**

| Syntax                                     | Bits | Mnemonic |
|--|------|----------|
| etv_application_information_descriptor() { |      |          |
| descriptor_tag                             | 8    | uimsbf   |
| descriptor_length                          | 8    | uimsbf   |
| application_control_code                   | 8    | uimsbf   |
| application_version()                      |      |          |
| max_protocol_version_major                 | 8    | uimsbf   |
| max_protocol_version_minor                 | 8    | uimsbf   |
| application_flags()                        |      |          |
| application_priority                       | 8    | uimsbf   |
| initial_resource_locator()                 |      |          |
| for (i=0; i<n; i++) {                      |      |          |
| private_data                               | 8    | bslbf    |
| }  |      |          |
| }  |      |          |

**descriptor\_tag** This 8-bit integer with value 0xE0 identifies this descriptor.  
**descriptor\_length** This 8-bit integer indicates the number of bytes following this field.  
**application\_control\_code** This 8-bit integer controls the state of the application. The semantics of this field are application type-dependent. This field is interpreted according to Table 8.

**Table 8 - ETV-BIF Application Control Code Values**

| Code | Identifier | Semantics   |
|------|------------|---|
| 0x00 |            | reserved_for_future_use   |
| 0x01 | AUTOSTART  | The primary application resource SHALL be loaded and transport layer signaling SHALL indicate that the application MAY be resumed, in accordance with the [ETV-BIF] Lifecycle section requirements for <i>eligible to run</i> . |

| Code      | Identifier | Semantics  |
|-----------|------------|--|
| 0x02      | PRESENT    | The primary application resource MAY be loaded, but transport layer signaling SHALL NOT indicate that the application MAY be resumed, in accordance with the [ETV-BIF] Lifecycle section requirements for <i>eligible to run</i> . |
| 0x03      | DESTROY    | Transport layer signaling SHALL indicate that the application SHALL be terminated, in accordance with the [ETV-BIF] Terminating section requirements for the Terminating transition.   |
| 0x04-0x06 |            | reserved_for_future_use  |
| 0x07      | SUSPEND    | Transport layer signaling SHALL indicate that the application SHALL be suspended, in accordance with the [ETV-BIF] Suspending section requirements for the Suspending transition.  |
| 0x08-0xff |            | reserved_for_future_use  |

A decoder SHALL implement the following behaviors when processing an `application_control_code`:

- A decoder SHALL register a loss of signaling event after 4 seconds of not receiving an AUTOSTART or PRESENT signal. A loss of signaling event SHALL be interpreted as semantically equivalent to a SUSPEND signal.
- After a maximum of 10 minutes of sustained loss of signaling for an application, a decoder SHALL terminate the application if not already terminated.
- A decoder SHALL terminate the application immediately on receiving a DESTROY signal.
- An application which is signaled with the SUSPEND control code SHALL NOT be eligible to run.
- An application which is signaled with the AUTOSTART control code SHALL be considered eligible to run from the transport layer signaling perspective, in accordance with the [ETV-BIF] Lifecycle section.
- If an application is signaled with the AUTOSTART or PRESENT control code but there is no page resource available, then a decoder SHALL ignore the descriptor. In this case, a decoder SHALL attempt to process subsequent descriptors.

**application\_version** This 16-bit field carries the application version. It is structured according to Table 9.

**Table 9 - ETV-BIF Application Version**

| Syntax                                | Bits | Mnemonic |
|---------------------------------------|------|----------|
| <code>application_version () {</code> |      |          |
| <code>version_major</code>            | 8    | uimsbf   |
| <code>version_minor</code>            | 8    | uimsbf   |
| <code>}</code>                        |      |          |

**version\_major** This 8 integer carries the major version of the application.

**version\_minor** This 8 integer carries the minor version of the application.

**max\_protocol\_version\_major** This 8-bit field, if non-zero, specifies the maximum major protocol version supported by user agents that should decode this application. An ETV user agent that supports EISS protocol versions greater than `max_protocol_version_major` SHALL ignore this descriptor. This

enables the user agent to ignore prior app version signaling in cases where a later version of the app is being signaled in this or subsequent EISS tables.

**max\_protocol\_version\_minor** This 8-bit field, if non-zero, specifies the maximum minor protocol version supported by user agents that should decode this application. If the maximum major protocol version supported by the user agent is equal to `max_protocol_version_major`, then an ETV user agent that supports EISS protocol versions greater than `max_protocol_version_minor` SHALL ignore this descriptor. This enables the user agent to ignore prior app version signaling in cases where a later version of the app is being signaled in this or subsequent EISS tables.

**application\_flags** This 32-bit field carries application flags. It is structured according to Table 10.

**Table 10 - ETV-BIF Application Flags**

| Syntax                             | Bits | Mnemonic |
|------------------------------------|------|----------|
| <code>application_flags() {</code> |      |          |
| <code>test_flag</code>             | 8    | bslbf    |
| <code>resource_update_flags</code> | 4    | bslbf    |
| <code>reserved</code>              | 20   | bslbf    |
| <code>}</code>                     |      |          |

**test\_flag** This 8-bit field conveys a set of test flags used to target this application to a specific population of set-top boxes. The usage of this field is governed by the cable operator and not further defined by this specification.

**resource\_update\_flags** This 4-bit field is a sequence number that is incremented whenever either (i) the `downloadID` field of the associated application carousel `DownloadInfoIndication` messages is changed, or (ii) the CRC32 field changes in the case that an associated data carousel is signaled using Section 8.2 *Alternate Constrained Data Carousels* format. When incrementing the value starts at 0x1 and from 0xf the value wraps to 0x1. A value of 0x0 indicates this field is not used and SHALL NOT increment.

**reserved** This 20-bit field is reserved by this specification and SHALL be set to 0x00000.

**application\_priority** This field identifies a relative priority between the applications signaled in this service.

- Where there is more than one application with the same Application identification, this priority SHALL be used to determine which application is started.
- Where there are insufficient resources to continue running a set of applications, this priority SHALL be used to determine which applications to terminate.
- The greater the numerical value, the higher the application priority.

**initial\_resource\_locator** This field identifies the locator for the initial page resource to be loaded by the receiver to execute the application identified by `application_identifier`. The initial page resource shall be conveyed in an elementary stream that is signaled by the same PMT that signaled the stream containing this EISS table. The format of the locator SHALL comply with the `ebiLocator` structure as defined in [ETV-BIF] Section 11.13 Locator.

For the purposes of this specification, the `lsType` locator type field of the `ebiLocator` structure SHALL be restricted to the following locator type:

- type 4 – URI Locator, wherein the URI SHALL match the URI that is conveyed in the DII message of the initial page resource. This form of locator SHALL be used to reference an initial page resource that conveys a Local Identifier (lid) URI scheme in its associated DII message.

If `application_control_code` equals 0x03 (DESTROY), the user agent SHALL ignore the value conveyed by `initial_resource_locator`, and in this case the value of the `length` field of `ebiLocator` MAY be zero (0).

#### **private\_data**

This field is defined as private use and is dependent upon the Application Type being signaled. This field SHALL be used to carry an application argument string as identified by [ETV-BIF] Application Arguments Section.

### 7.2.2 ETV Media Time Descriptor

ETV media time descriptors enable a receiver to maintain a program-specific timeline that can be referenced by a stream event for synchronization of an application to a broadcast program. This descriptor contains a value that allows the receiver to establish a unique time for each point within the program, even when that program is interrupted for advertisements or is joined in progress.

The ETV media time descriptor is defined in Table 11.

**Table 11 - ETV Media Time Descriptor Syntax**

| Syntax                                     | Bits | Mnemonic |
|--|------|----------|
| <code>etv_media_time_descriptor() {</code> |      |          |
| <code>descriptor_tag</code>                | 8    | uimsbf   |
| <code>descriptor_length</code>             | 8    | uimsbf   |
| <code>time_value</code>                    | 32   | uimsbf   |
| <code>}</code>                             |      |          |

**descriptor\_tag** This 8-bit integer with value 0xE1 identifies this descriptor.

**descriptor\_length** This 8-bit integer indicates the number of bytes following the `descriptor_length` field.

**time\_value** This field contains the time in milliseconds since the beginning of the current program.

It is not necessary for a program to actually start at time 0, as long as the Stream Event descriptors tied to these time codes accommodate for the actual time values delivered in this stream. Consecutive `time_values` SHALL NOT have negative time discontinuities after discounting the interval of time passed between two consecutive `etv_media_time_descriptors`. Consecutive `time_values` MAY have positive time discontinuities between two consecutive `etv_media_time_descriptors`.

The user agent SHALL provide forwards extrapolation of `time_value` for the application between receiving two consecutive `etv_media_time_descriptors`.

### 7.2.3 ETV Stream Event Descriptor

ETV stream event descriptors carry application data to be delivered to an application synchronously with the broadcast event. The ETV stream event descriptor is defined in Table 12.

**Table 12 - ETV Stream Event Descriptor Syntax**

| Syntax                                       | Bits | Mnemonic |
|--|------|----------|
| <code>etv_stream_event_descriptor() {</code> |      |          |
| <code>descriptor_tag</code>                  | 8    | uimsbf   |
| <code>event_counter</code>                   | 4    | bslbf    |
| <code>descriptor_length</code>               | 12   | uimsbf   |
| <code>time_value</code>                      | 32   | uimsbf   |
| <code>header_type</code>                     | 3    | uimsbf   |
| <code>payload_type</code>                    | 5    | uimsbf   |
| <code>for (i=0; i&lt;N; i++) {</code>        |      |          |
| <code>payload_byte</code>                    | 8    | bslbf    |
| <code>}</code>                               |      |          |
| <code>}</code>                               |      |          |

|                          |  |
|--------------------------|--|
| <b>descriptor_tag</b>    | This 8-bit integer with value 0xE2 identifies this descriptor.   |
| <b>event_counter</b>     | This 4-bit field provides an event counter and SHALL increment by 0x1 for each non-duplicated stream event with the same application identifier, application instance identifier and platform id. When event_counter reaches 0xf it is incremented to 0x0. Duplicate stream events MAY be signaled by conveying the same value of the event counter in consecutive stream events. The bits of etv_stream_event_descriptor for duplicate stream events SHALL be identical. One and only one of the duplicated stream events SHALL be delivered to the application. Duplicate stream events (i) SHALL be consecutive to their first occurrence (i.e. SHALL NOT be interleaved with other stream events); and (ii) SHALL be delivered in separate EISS tables. The numeric sequencing of the event_counter field is scoped to application identifier, application instance identifier and platform id fields in the EISS. |
| <b>descriptor_length</b> | This 12-bit integer indicates the number of bytes following the descriptor_length field.   |
| <b>time_value</b>        | This field indicates the time at which the event SHOULD be delivered to the application on the receiver. There will be some inevitable delay based on the processing power of the receiver. If time_value is equal to 0, the event SHALL be delivered immediately. The semantics related to this field are described in Section 7.2.2.   |
| <b>header_type</b>       | An enumeration value indicating the event header type. The values of this enumeration are defined by [ETV-BIF] Trigger Format section, Trigger Header Types Table.   |
| <b>payload_type</b>      | An enumeration value indicating the event payload type. The values of this enumeration are defined by [ETV-BIF] Trigger Format section, Trigger Payload Types Table.   |
| <b>payload_byte</b>      | This field contains application-dependent data. This field SHALL be interpreted according to the format described by [ETV-BIF] Serialized Trigger section. In this case, and in order to provide EBIF defined trigger payload, the trigger header type SHALL NOT be the value for none; see [ETV-BIF]. This version of the specification does not support serialized triggers with the header type of None.  |

## 7.2.4 ETV Application Metadata Descriptor

ETV application metadata descriptors carry application metadata information synchronously with the broadcast event. These metadata items override the same metadata items embedded in the ETV application. The metadata items could be assembled from more than one MPEG sections.

An ETV application metadata descriptor SHALL be delivered in the same table as an ETV application information descriptor.

The ETV application metadata descriptor is defined in Table 13.

**Table 13 - ETV Application Metadata Descriptor Syntax**

| Syntax  | Bits | Mnemonic |
|---|------|----------|
| <code>etv_application_metadata_descriptor() {</code>            |      |          |
| <code>descriptor_tag,</code>                                    | 8    | uimsbf   |
| <code>reserved1,</code>   | 4    | bslbf    |
| <code>descriptor_length,</code>                                 | 12   | uimsbf   |
| <code>count</code>  | 8    | uimsbf   |
| <code>for (i=0; i&lt;count; i++) {</code>                       |      |          |
| <code>metadata_item_id</code>                                   | 24   | uimsbf   |
| <code>metadata_item_type</code>                                 | 4    | bslbf    |
| <code>metadata_item_size_in_bytes</code>                        | 12   | uimsbf   |
| <code>for (j=0; j&lt;metadata_item_size_in_bytes; j++) {</code> |      |          |
| <code>metadata_item_value_byte</code>                           | 8    | bslbf    |
| <code>}</code>  |      |          |
| <code>}</code>  |      |          |
| <code>}</code>  |      |          |

**descriptor\_tag** This 8-bit integer with value 0xE5 identifies this descriptor.

**reserved1** This 4-bit field SHALL be set to 0000.

**descriptor\_length** This 12-bit integer indicates the number of bytes following the `descriptor_length` field.

**count** This 8-bit integer indicates the number of metadata items contained in this descriptor.

**metadata\_item\_id** This 24-bit integer represents the metadata item id as defined in the Metadata Items Annex in [ETV-BIF]. In this version of the specification, only metadata items within the private use range (0xFF0000 - 0xFFFFFE) SHALL be supported for use with this descriptor.

**metadata\_item\_type** This 4-bit integer indicates the type of the metadata item value, and is interpreted according to Table 14 - Metadata Item Type Values.

**Table 14 - Metadata Item Type Values**

| Value | Description                          |
|-------|--------------------------------------|
| 0x0   | unsigned integer                     |
| 0x1   | Boolean (0 = FALSE, non-zero = TRUE) |
| 0x2   | String (UTF-8)                       |
| 0xF   | reserved_for_future_use              |

**Note:** Metadata item types and sizes SHALL conform to the types defined in the [ETV-BIF] Common Data Types Section.

**metadata\_item\_size\_in\_bytes** This 12-bits integer indicates the number of bytes used by this metadata item value.

**metadata\_item\_value\_byte** This 8-bit field makes up the value of the metadata item.

### 7.3 Synchronization in Analog Services

Synchronization and signaling for analog services is outside the scope of this document.

## 8 CARRIAGE OF ETV APPLICATION RESOURCE DATA

This section describes the carriage of ETV application resource data within an MPEG-2 Transport Stream. A common portable format must be established that may be interpreted by all receivers, and which can be generated by all authoring and packaging tools.

### 8.1 DSM-CC Data Carousel

If the Elementary Stream that carries ETV Resources is signaled with a `stream_type` of 0x0B (IEC 13818-6 Type B - DSM-CC Data Carousel [IEC 13818-6]), the application resource data is carried in a DSM-CC Data Carousel as defined in [IEC 13818-6]. No constraints are placed on the Data Carousel by this specification.

The contents of sections 7 and 9 of [IEC 13818-6] are hereby incorporated into this specification; and, for the purposes of the OpenCable Contribution Agreement, SHALL be considered a “Contribution” to this specification, subject to the IPR terms and conditions (including each signatory’s opportunity to provide notice) of the OpenCable Contribution Agreement.

The following fields of the DownloadInfoIndication (DII) message are further specified by this specification:

**moduleInfoByte** The moduleInfoByte fields of the DII message MAY specify the *abs\_path* component of the Local Identifier (lid:) URI Scheme [SMPTE 343M] to be used to locate this module when used by a URI Locator as defined by [ETV-BIF]. If moduleInfoByte fields are specified, then the user agent SHALL provide a mapping to this module for lid: URI Locators that reference this module using *authority* and *abs\_path*. The moduleInfoByte fields contain the *abs\_path* structure as defined in Table 15.

**Table 15 - *abs\_path***

| Syntax                                | Bits | Mnemonic |
|---------------------------------------|------|----------|
| <code>abs_path() {</code>             |      |          |
| <code>abs_path_length</code>          | 8    | uimsbf   |
| <code>for (i=0; i&lt;N; i++) {</code> |      |          |
| <code>abs_path_byte</code>            | 8    | bslbf    |
| <code>}</code>                        |      |          |
| <code>}</code>                        |      |          |

**abs\_path\_length** This 8-bit integer indicates the number of bytes of the *abs\_path* structure following the *abs\_path\_length* field.

**abs\_path\_byte** This field contains the bytes of the *abs\_path* component of the lid: URI scheme.

**privateDataByte** The privateDataByte fields of the DII message MAY specify the *authority* component of the Local Identifier (lid:) URI Scheme [SMPTE 343M] to be used to locate the resources identified by this DII message when referenced by an lid: URI Locator as defined by [ETV-BIF]. The privateDataByte fields contain the *authority* structure as defined in Table 16.

**Table 16 - authority**

| Syntax                                  | Bits | Mnemonic |
|---|------|----------|
| authority() {<br>authority_length       | 8    | uimsbf   |
| for (i=0; i<N; i++) {<br>authority_byte | 8    | bslbf    |
| }<br>}                                  |      |          |

**authority\_length** This 8-bit integer indicates the number of bytes of the *authority* structure following the *authority\_length* field.

**authority\_byte** This field contains the bytes of the *authority* component of the lid: URI scheme. Resources for a single authority SHALL NOT be conveyed on more than one data carousel in a given elementary stream. Resources for different authorities SHALL be conveyed on different data carousels in a given elementary stream. In other words, a DII SHALL map all resources that are being conveyed for a given authority in the elementary stream at any given moment.

## 8.2 Alternate Constrained Data Carousels

If the Elementary Stream that carries ETV Resources is signaled with a *stream\_type* of 0xC0 (DCII Text Message), ETV Resources SHALL be encapsulated within a constrained data carousel as defined in Table 17. This constrained data carousel carries a DSM-CC\_Section as defined in [IEC 13818-6]. The primary constraint imposed by this format is the limitation that each *dc2\_data\_carousel\_section* is limited in size to less than 1 KB.

**Table 17 - DCII Data Carousel Message Syntax**

| Syntax  | Bits | Mnemonic |
|---|------|----------|
| dc2_data_carousel_section() {<br>table_id     | 8    | uimsbf   |
| section_syntax_indicator                      | 1    | bslbf    |
| reserved1                                     | 3    | bslbf    |
| section_length                                | 12   | uimsbf   |
| filter_info                                   | 16   | uimsbf   |
| reserved2                                     | 8    | bslbf    |
| for (i=0; i<N; i++) {<br>dsmcc_section()<br>} |      |          |
| CRC32   | 32   | rpchof   |
| }   |      |          |

**table\_id** This 8-bit integer with value 0xE3 or 0xE4 identifies this descriptor. If the enclosed *dsmcc\_section* carries a DII message, this field SHALL convey the value 0xE3. If the enclosed *dsmcc\_section* carries a DownloadDataBlock (DDB) message, this field SHALL convey the value 0xE4.

**section\_syntax\_indicator** The *section\_syntax\_indicator* is a 1-bit field which SHALL be set to 0.

**reserved1** This 3-bit field is reserved by this specification and SHALL be set to '100'.

|                       |  |
|-----------------------|--|
| <b>section_length</b> | This 12-bit field specifies the number of bytes in the section starting immediately following the <code>section_length</code> field. The value in this field SHALL not exceed 1021, indicating that the encapsulated <code>dsmcc_section</code> SHALL have a maximum length of 1014 bytes.   |
| <b>filter_info</b>    | This 16-bit field is intended to accommodate hardware filtering of messages. If the enclosed <code>dsmcc_section</code> carries a DII message, this field SHALL convey the value 0xFBFB. If the enclosed <code>dsmcc_section</code> carries a DDB message, this field SHALL convey a copy of the <code>moduleId</code> field of the conveyed DSMCC DDB message. The set of values for the <code>moduleId</code> SHALL be limited to within the range 0x0001 and 0xFBEB. This enables a receiver to set hardware filters on all DSMCC DII control messages and specific download data modules in <code>dsmcc_section</code> sections. |
| <b>reserved2</b>      | This 8 bit field SHALL be set to 0x00.   |
| <b>dsmcc_section</b>  | This field carries a DSM-CC_Section as defined in [IEC 13818-6], table 9-2. When a DSM-CC section is encapsulated by a <code>dc2_data_carousel_section</code> the maximum length of that DSM-CC section is 1014 bytes.   |
| <b>CRC-32</b>         | This field SHALL be set as defined in [IEC 13818-1], Annex B.  |

### 8.3 Timing of EISS signal and DII message

If a new application is signaled by an EISS Application Information Descriptor with either a PRESENT or AUTOSTART control code, the first DII message corresponding to the signaled initial page resource and other resources SHALL be inserted before EISS control codes.

## 9 APPLICATION SIGNALING AND SYNCHRONIZATION FOR LIMITED CAPABILITY DEVICES

### 9.1 Introduction

ETV applications will be deployed on a wide range of receivers, including devices such as the Motorola DCT-2000. Some devices do not have the resources necessary to support advanced signaling techniques. Programmers and network operators may choose to simultaneously broadcast both messaging types in order to target the widest range of devices; however, all devices must be capable of reading the base signaling stream.

The critical resource constraint of limited-capability devices is the number of PID filters, which has required the combination of several elements into the Integrated Signaling Stream as described in Section 7 of this specification.

An overall review of the descriptor elements introduced in this specification is illustrated in Figure 3:

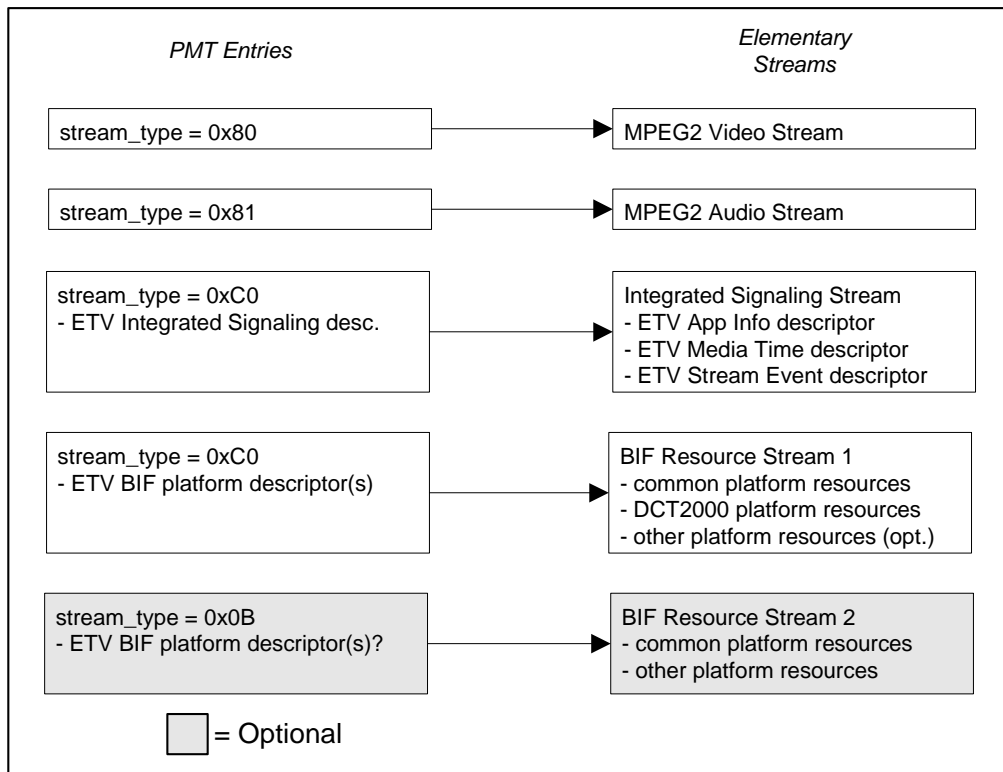

Figure 3 - PMT Signaling Motorola DCT-2000 Specific Behaviors

The User Agent running on a DCT-2000 SHALL read the first four PMT entries in the above table. The ETV Integrated Signaling Descriptor in the third PMT entry indicates that the associated elementary stream carries a signaling stream that includes an AIT-like Application Information descriptor, the Media Time descriptors, and any Stream Event descriptors.

The ETV-BIF Platform descriptor in the fourth entry indicates that this elementary stream carries ETV-BIF resources for the specified platforms.

If one or more elementary streams contains ETV-BIF resources targeted to a DCT-2000 receiver, those streams will have a `stream_type` of 0xC0 (DCII Text Message). Those resources that are not required to be processed by a DCT-2000 MAY be signaled with a `stream_type` of 0xC0 or 0x0B (DSM-CC Data Carousel).

## 9.2 All other Set-Top Specific Behaviors

User Agents running on all other receivers SHALL read the first three PMT entries, just as the DCT-2000. The Application Information descriptor in the EISS will contain an `application_identifier`, which, in this case, MAY reflect the presence of resources in either the fourth or fifth stream (or both) above. The User Agent SHALL read each PMT entry to find the resources most suitable for the given hardware and/or software platform and load from those streams as required.

## 9.3 OpenCable Host Specific Behaviors

No specific signaling or behaviors have been identified for OpenCable hosts.

## Appendix I Revision History

The following ECNs were incorporated into OC-SP-ETV-AM-I02-050726:

| Number             | Description  | Date    |
|--------------------|--|---------|
| ETV-AM-N-05.0785-2 | Support for single ETV data PID  | 7/13/05 |
| ETV-AM-N-05.0786-2 | Correction to filter_info values in App Resource stream                  | 7/13/05 |
| ETV-AM-N-05.0804-1 | Improved specification for time_value field of etv_media_time_descriptor | 7/20/05 |

The following ECNs were incorporated into OC-SP-ETV-AM1.0-I03-060714:

| Number                | Description                       | Date    |
|-----------------------|-----------------------------------|---------|
| ETV-AM-N-05.0828-3    | Collected changes for ETV AM      | 1/16/06 |
| ETV-AM1.0-N-06.0861-3 | Improved support for enhanced Ads | 4/3/06  |

The following ECN was incorporated into OC-SP-ETV-AM1.0-I04-070921:

| Number                | Description                     | Date    |
|-----------------------|---------------------------------|---------|
| ETV-AM1.0-N-06.0963-2 | Collected and editorial changes | 4/10/07 |

The following ECNs were incorporated into OC-SP-ETV-AM1.0-I05-091125:

| Number                | Description  | Date     |
|-----------------------|--|----------|
| ETV-AM1.0-N-08.1196-1 | Clarify Hardware/Software Version field descriptions | 4/1/08   |
| ETV-AM1.0-N-09.1401-2 | Application Priority Clarification                   | 11/25/09 |
| ETV-AM1.0-N-09.1429-2 | Initial Page Resource location clarification         | 11/25/09 |

The following ECNs were incorporated into OC-SP-ETV-AM1.0-I06-110128:

| <b>Number</b>          | <b>Description</b>   | <b>Date</b> |
|------------------------|--|-------------|
| ETV-AM1.0-N-09.1474-3  | Change to eiss_section() table_id  | 1/28/11     |
| ETV-AM1.0-N-09.1476-10 | Addition of SUSPEND Control Code, Resource Update and Stream Event Sequence Numbers    | 1/28/11     |
| ETV-AM1.0-N-10.1494-1  | Explicit definition of the timing requirement for DII and corresponding EISS signaling | 1/28/11     |
| ETV-AM1.0-N-10.1532-1  | Define a new EISS descriptor for signaling and interchanging metadata items            | 1/28/11     |

---
